

(New Version) Grasping All The New Microsoft 70-465 Exam Questions and Answers And Passing Exam Doubtless (41-50)

Attention: These 70-465 Exam Questions Were Updated After 2014/10/1 With The Change Of New Microsoft Exam. 100 Percent Valid And 100 Percent Pass Ensure. Visit Our PassLeader Website And Get All Valid Exam Questions With PDF And VCE.

QUESTION 41 You need to recommend a solution for the deployment of SQL Server 2014. The solution must meet the business requirements. What should you include in the recommendation? A. Create a new instance of SQL Server 2014 on the server that hosts the SQL Server 2008 instance. B. Upgrade the existing SQL Server 2008 instance to SQL Server 2014. C. Deploy two servers that have SQL Server 2014 installed and implement Failover Clustering. D. Deploy two servers that have SQL Server 2014 installed and implement database mirroring. Answer: C

QUESTION 42 You need to recommend a solution to improve the performance of usp.UpdateInventory. The solution must minimize the amount of development effort. What should you include in the recommendation?

A. A table variable B. A common table expression C. A subquery D. A cursor Answer: A

QUESTION 43 You need to recommend a disk monitoring solution that meets the business requirements. What should you include in the recommendation? A. a SQL Server Agent alert B. a dynamic management view C. a maintenance plan D. an audit Answer: A

QUESTION 44 You need to recommend a solution for Application1 that meets the security requirements. What should you include in the recommendation? A. Encrypted columns B. Certificate Authentication C. Secure Socket Layer (SSL) D. Signed stored procedures Answer: A

QUESTION 45 You need to recommend a feature to support your backup solution. What should you include in the recommendation? A. Transparent Data Encryption (TDE) B. Column-level encryption C. An NTFS file permission D. A Secure Sockets Layer (SSL) Answer: A

The solution must meet the business requirements. What should you recommend? A. Create stored procedures that use EXECUTE AS clauses. B. Create a user-defined database role and add users to the role. C. Create functions that use EXECUTE AS clauses. D. Create a Policy-Based Management Policy. Answer: A

QUESTION 47 You need to recommend a database reporting solution that meets the business requirements. What should you include in the recommendation?

A. Data collection B. Performance Monitor C. A maintenance plan D. A dynamic management view Answer: A

QUESTION 48 You need to recommend a solution to synchronize Database2 to App1_Db1. What should you recommend? A. Change data capture B. Snapshot replication C. Master Data Services D. Transactional replication Answer: D

QUESTION 49 During performance testing, you discover that database INSERT operations against the Inventory table are slow. You need to recommend a solution to reduce the amount of time it takes to complete the INSERT operations. What should you recommend? A. Partition the nonclustered index.

B. Partition the Inventory table. snapshot replication C. Create a column store index. Master Data Services D. Drop the clustered index. change data capture Answer: A Case Study 2: Contoso, Ltd (Question 50 - Question 59) Overview Application Overview Contoso, Ltd., is the developer of an enterprise resource planning (ERP) application. Contoso is designing a new version of the ERP application. The previous version of the ERP application used SQL Server 2008 R2. The new version will use SQL Server 2014. The ERP application relies on an import process to load supplier data. The import process updates thousands of rows simultaneously, requires exclusive access to the database, and runs daily. You receive several support calls reporting unexpected behavior in the ERP application. After analyzing the calls, you conclude that users made changes directly to the tables in the database. Tables The current database schema contains a table named OrderDetails. The OrderDetails table contains information about the items sold for each purchase order. OrderDetails stores the product ID, quantities, and discounts applied to each product in a purchase order. The product price is stored in a table named Products. The Products table was defined by using the SQL_Latin1_General_CP1_CI_AS collation. A column named ProductName was created by using the varchar data type. The database contains a table named Orders. Orders contains all of the purchase orders from the last 12 months. Purchase orders that are older than 12 months are stored in a table named OrdersOld. The previous version of the ERP application relied on table-level security. Stored Procedures The current version of the database contains stored procedures that change two tables. The following shows the relevant portions of the two stored procedures:

```
CREATE PROCEDURE UpdateSales
AS
BEGIN TRANSACTION
UPDATE Sales SET Sales = Sales + 1
UPDATE Sales SET Sales = Sales + 1
COMMIT TRANSACTION
GO

CREATE PROCEDURE UpdateSales
AS
BEGIN TRANSACTION
UPDATE Sales SET Sales = Sales + 1
UPDATE Sales SET Sales = Sales + 1
COMMIT TRANSACTION
GO
```

Customer Problems Installation Issues The current version of the ERP application requires that several SQL Server logins be set up to function correctly. Most customers set up the ERP application in multiple locations and must create logins multiple times. Index Fragmentation Issues Customers discover that clustered indexes often are fragmented. To resolve this issue, the customers defragment the indexes more frequently. All of the tables affected by fragmentation have the following columns that are used as the clustered index key:

Column	Data type
id	uniqueidentifier
lastModified	datetime
modifiedBy	varchar(200)

Backup Issues Customers who have large amounts of historical purchase order data report that backup time is unacceptable. Search Issues Users report that when they search product names, the search results exclude product names that contain accents, unless the search string includes the accent. Missing Data Issues Customers report that when they make a price change in the Products table, they cannot retrieve the price that the item was sold for in previous orders. Query Performance Issues Customers report that query performance degrades very quickly. Additionally, the customers report that users cannot run queries when SQL Server runs maintenance tasks. Import Issues During the monthly import process, database administrators receive many support calls from users who report that they cannot access the supplier data. The database administrators want to reduce the amount of time required to import the data. Design Requirements File Storage Requirements The ERP database stores scanned documents that are larger than 2 MB. These files must only be accessed through the ERP application. File access must have the best possible read and write performance. Data Recovery Requirements If the import process fails, the database must be returned to its prior state immediately. Security Requirements You must provide users with the ability to execute functions within the ERP application, without having direct access to the underlying tables. Concurrency Requirements You must reduce the likelihood of deadlocks

occurring when Sales.Prod and Sales.Proc2 execute. QUESTION 50 You need to recommend a solution that addresses the index fragmentation and index width issue. What should you include in the recommendation? (Each correct answer presents part of the solution. Choose all that apply.) A. Change the data type of the lastModified column to smalldatetime. B. Remove the lastModified column from the clustered index. C. Change the data type of the modifiedBy column to tinyint. D. Change the data type of the id column to bigint. E. Remove the modifiedBy column from the clustered index. F. Remove the id column from the clustered index. Answer: BE
